

An introduction to ChIP-seq & ATAC-seq analysis

Carl Herrmann / Ashwini Sharma

14-15 December 2020

Health Data Science Unit
Medical Faculty Heidelberg & BioQuant
carl.herrmann@uni-heidelberg.de

Medizinische Fakultät Heidelberg

Who are we ??

Medizinische Fakultät Heidelberg

Carl Herrmann

- Lecturer Heidelberg University
- Group leader *Biomedical Genomics* (BMG) @ Health Data Science Unit - Medical Faculty & BioQuant
- Interested in
 1. understanding transcription regulation in development and disease;
 2. developing computation/statistical methods for data integration
- mathematician → engineer → theoretical physicist → bioinformatician → ...
- proud father of four daughters

@CarlMHerrmann

Ashwini K. Sharma

- Computational Biologist
- Postdoc in the BMG group
- Interested in applying integrative genomics based approaches using various statistical and computational methods towards understanding tumour biology and other diseases

<https://ashwini-kr-sharma.github.io/>

*Thank you Andres Quintero
for technical support!*

Goals

Medizinische Fakultät Heidelberg

- **What we will cover**
 - why are we doing ChIP-seq/ATAC-seq at all?
 - what are the main steps of the bioinformatics workflow?
 - how can we distinguish a good from a bad dataset (QC!) ?
 - which tools are available for each step of the analysis?
- **What we will NOT cover** (yet...)
 - (some) gory details
 - alternative ChIP-seq protocols (cut&run / cut&tag / ...)
 - DNA methylation / RNA-seq / whatever-seq
 - single-cell ATAC-seq / single-cell whatever-seq
- **After this course, you will be able to**
 - **perform some of the analysis yourself**
 - **talk without shame to your favorite bioinformatician**

Schedule

Medizinische Fakultät Heidelberg

Day 1 : ChIP-seq analysis

- **10am - 11am**
General introduction on experimental and computational concepts
- **11am - 12.30am**
First steps in the bioinformatics workflow (lectures + hands-on)
 - ▶ read QC / trimming / alignment
- **1.30pm - 5.30pm**
Next steps in the bioinformatics workflow (lectures + hands on)
 - ▶ peak calling
 - ▶ peak annotation
 - ▶ signal tracks
 - ▶ IGV visualization

Day 2 : ATAC-seq analysis

- **10am - 12.30pm**
First steps in the bioinformatics workflow (lectures + hands-on)
 - ▶ read QC / trimming / alignment
 - ▶ peak calling / peak annotation
- **1.30pm - 5.30pm**
ATAC-seq specific part
 - ▶ QC
 - ▶ Footprinting
 - ▶ Integration with ChIP-seq
 - ▶ ...

Medizinische Fakultät Heidelberg

Understanding gene regulation

Transcriptional regulation

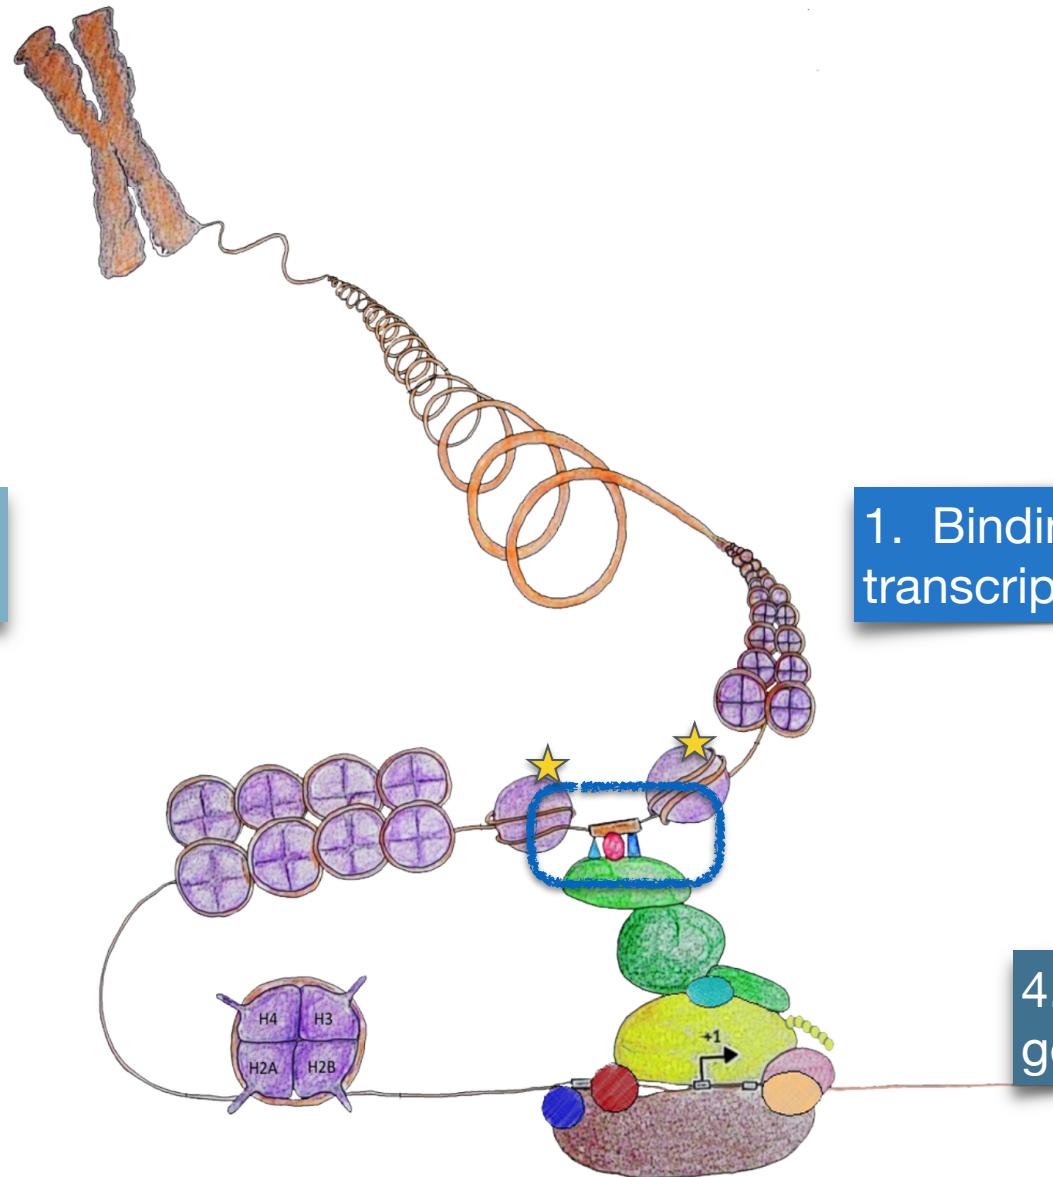

Medizinische Fakultät Heidelberg

2. chromatin structure,
epigenetic

1. Binding of site specific
transcription factors

3. three-dimensional
DNA looping

4. Readout:
gene expression

[Elodie Darbo]

Experimental methods

Heidelberg

- **Genetic component:**
- **Chromatin structure and epigenetic**
- **Three-dimensional DNA looping**
- **Readout: gene expression**

Experimental methods

Heidelberg

- **Sequence component:**

→ ChIP-seq: transcription factor binding sites

- **Chromatin structure and epigenetic**

→ ChIP-seq : post-translational histone modifications

→ whole genome bisulfite sequencing, arrays : DNA methylation

→ ATAC-seq, DNase-seq, FAIRE-seq : open chromatin region

- **Three-dimensional DNA looping**

→ 3C/4C/Hi-C : interacting chromatin regions

- **Readout: gene expression**

→ RNA-seq : expression of transcribed elements

Exploring the genome's activity

Medizinische Fakultät Heidelberg

- Large scale consortia (ENCODE, Roadmap, ...) have systematically explored the **activity** of the genome using experimental assays

"The vast majority (80.4%) of the human genome participates in at least one biochemical RNA- and/or chromatin-associated event in at least one cell type.

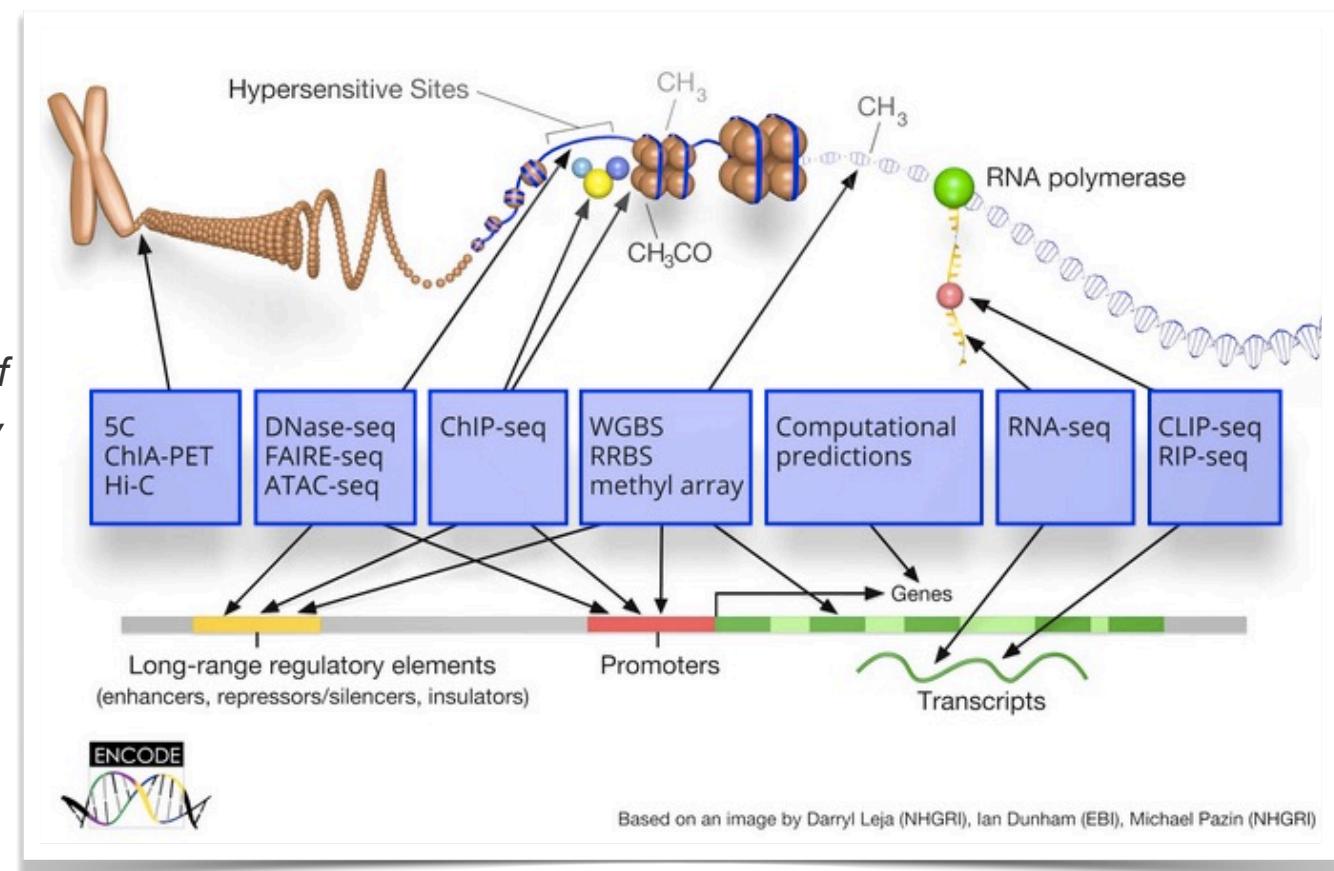

99% is within 1.7kb of at least one of the biochemical events measured by ENCODE."

Michael Eisen
@mbeisen

@dgmcarthur measurable biochemical activity is a meaningless measure of functional significance

ChIP-seq for histone modifications

- histones are subject to **post-translational modifications** at their N-terminal tail
 - Lysine methylation
 - Lysine/arginine acetylation
 - Serine phosphorylation
 - ubiquitylation
- they **modify the physical properties of the DNA-nucleosome interactions**

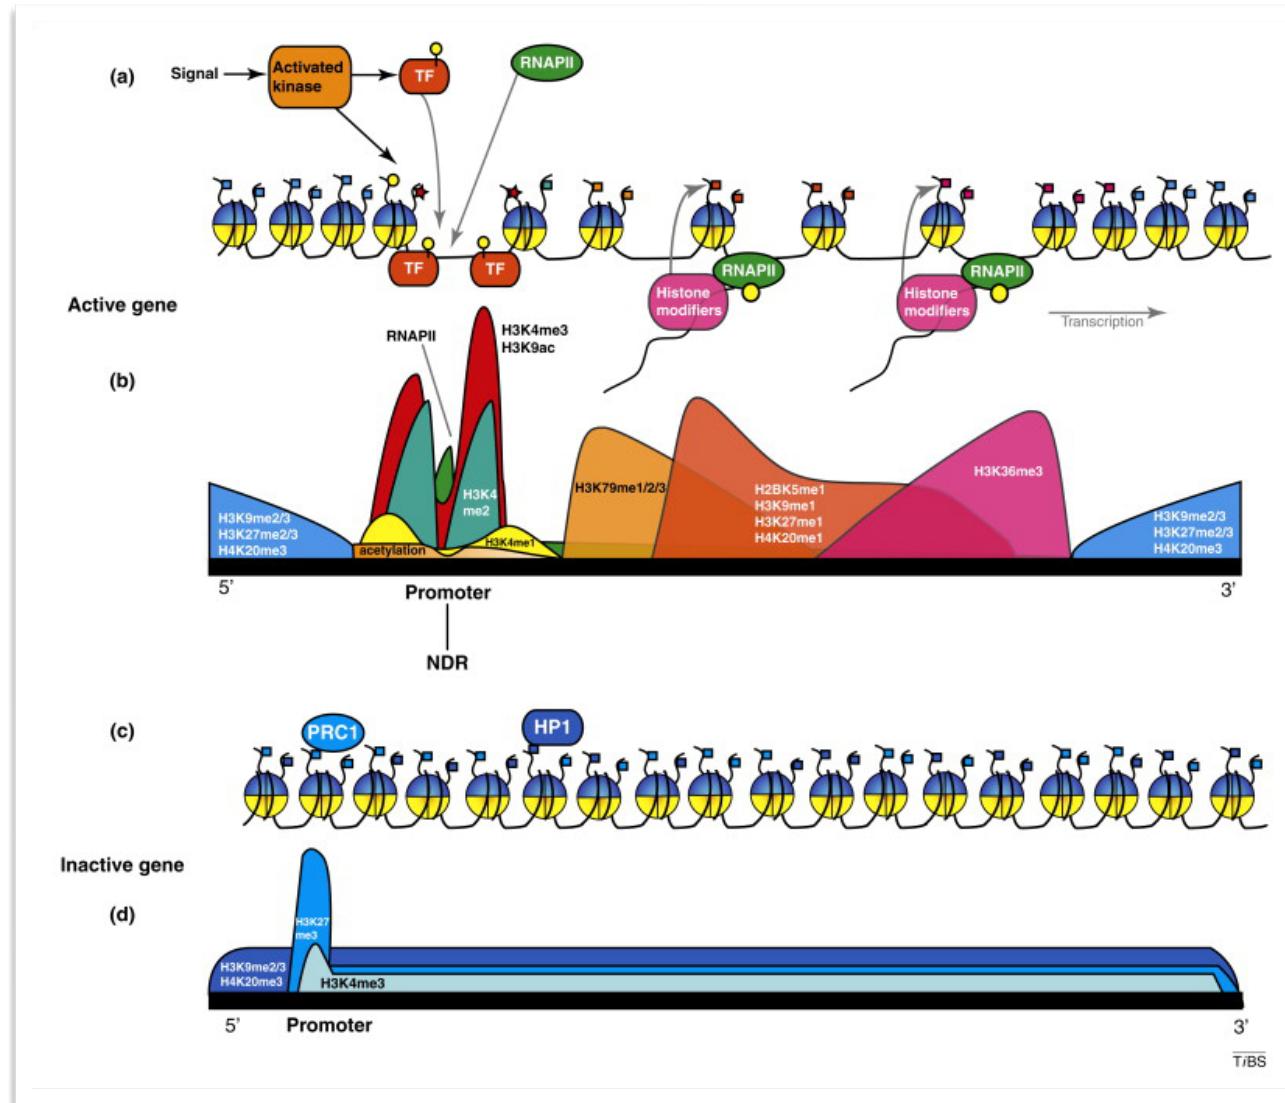

nomenclature: H3K27ac = acetylation of lysine 27 on histone 3

Histone modifications

Medizinische Fakultät Heidelberg

histone modifications are a good proxy of gene expression and presence of regulatory elements

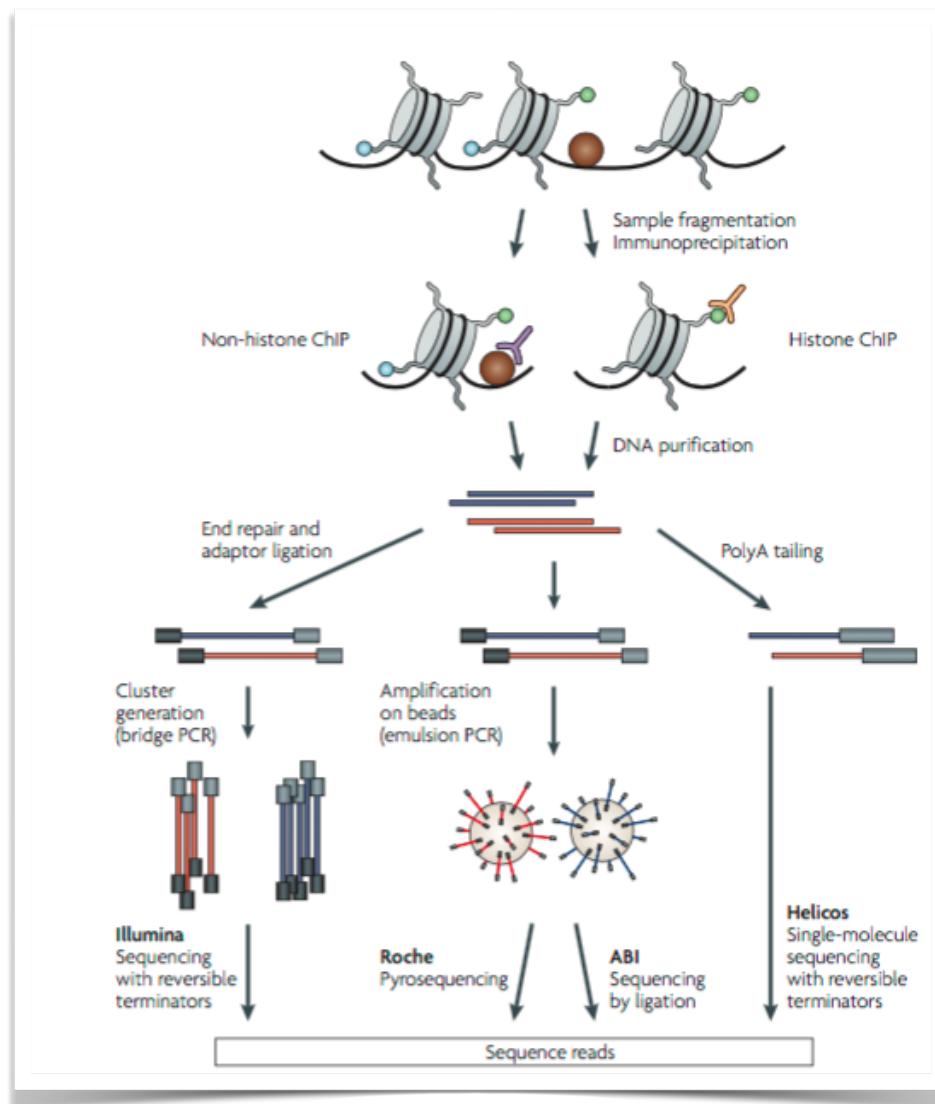

active marks

→ open chromatin
H3K4me1; H3K4me3;
H3K27ac

repressive marks

→ closed chromatin
H3K27me3; H3K9me3

Chromatin Immunoprecipitations

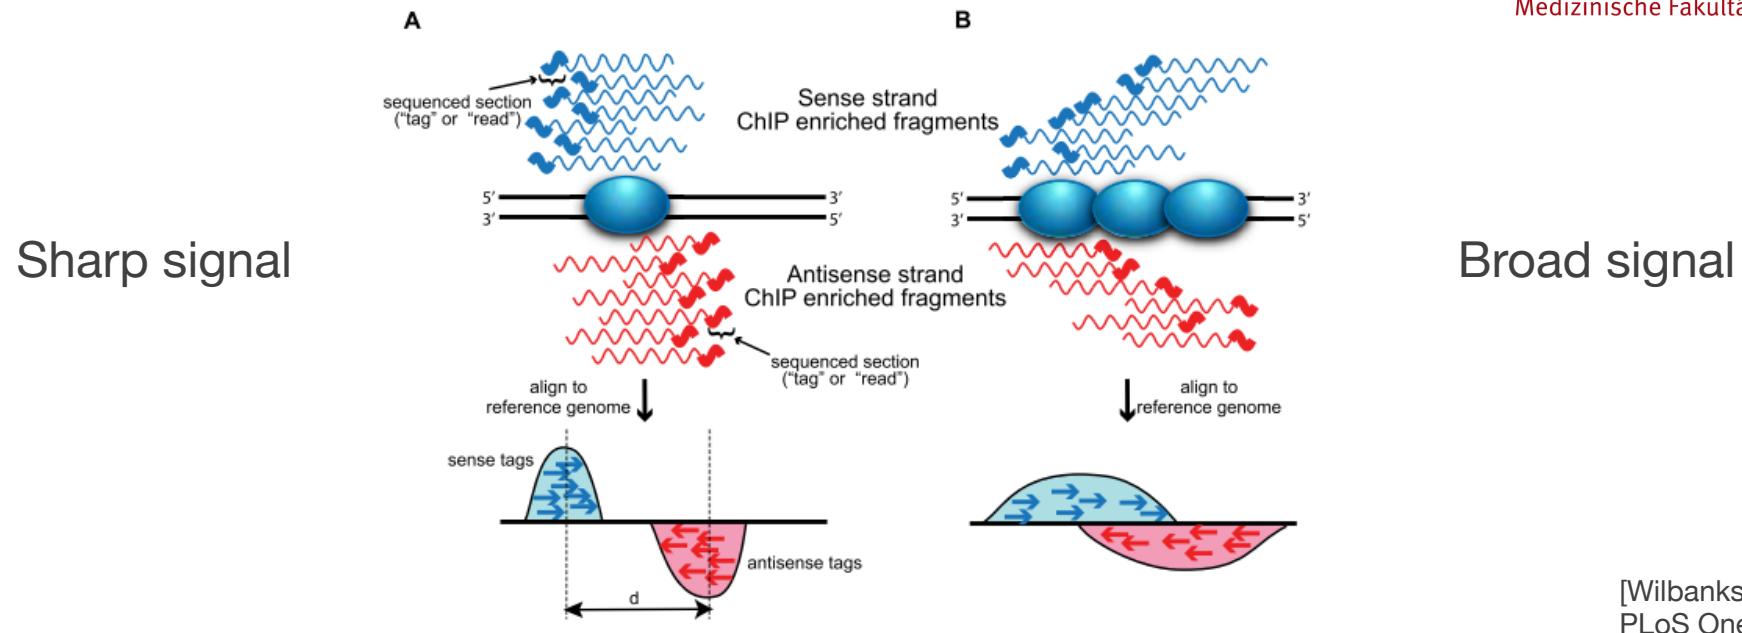

[Park, Nat.Rev. 2009]

- Chromatin immunoprecipitation (ChIP) yields **DNA fragments**, that are
 - bound by the protein of interest
 - marked by a specific chemical modification (acetylation, methylation,..)
- Identification of the fragments :
 - sequencing (ChIP-seq)
→ genome-wide
 - PCR/qPCR
→ targeted experiment
- Important aspect
 - Quality/Specificity of the antibody ?
 - DNA fragment (~200-300bp)
→ binding site (~10 bp) ?

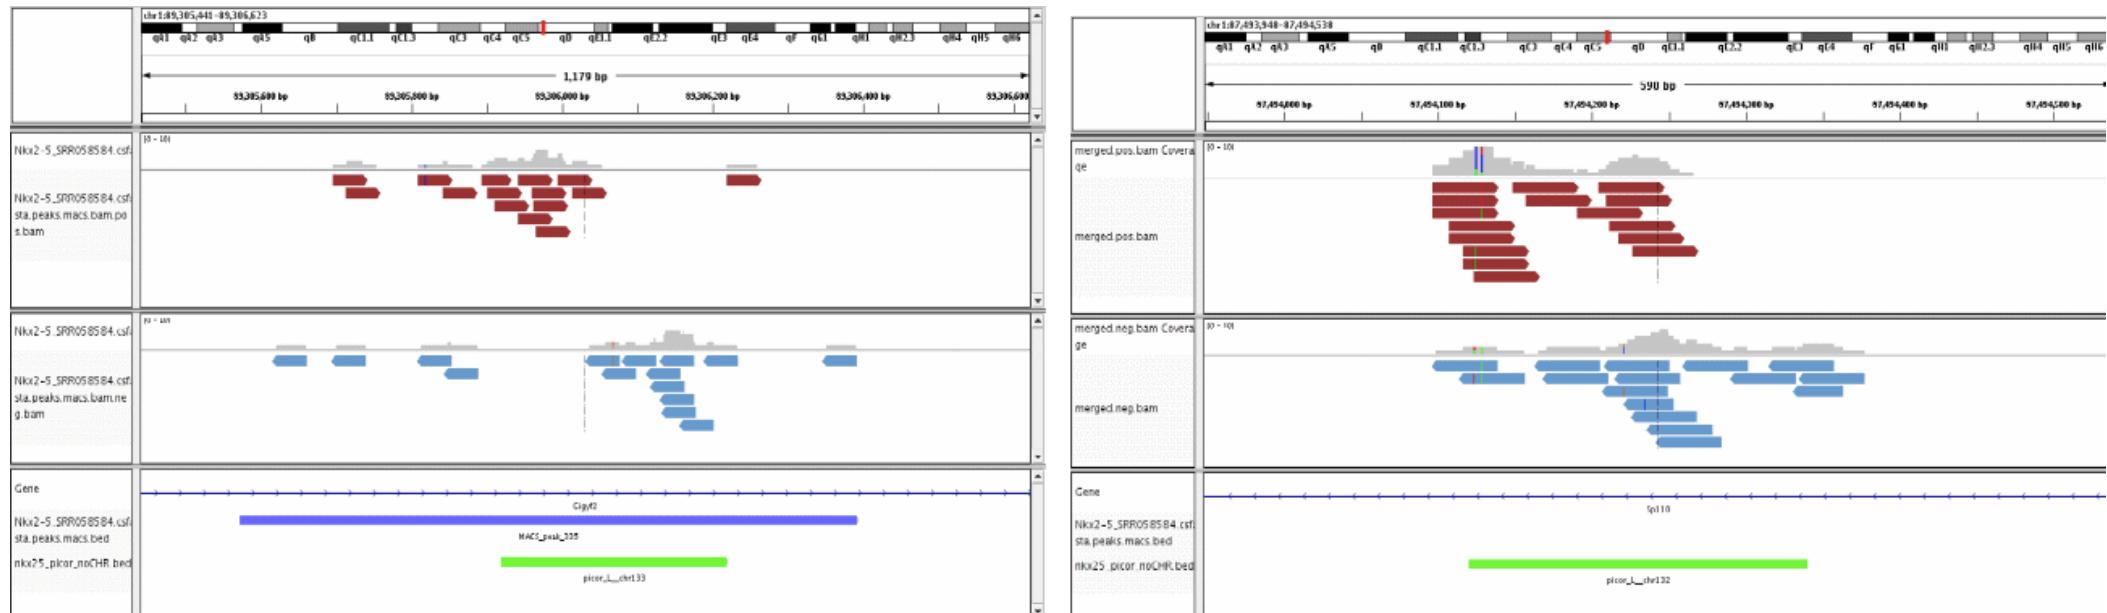

ChIP-sequencing

Medizinische Fakultät Heidelberg

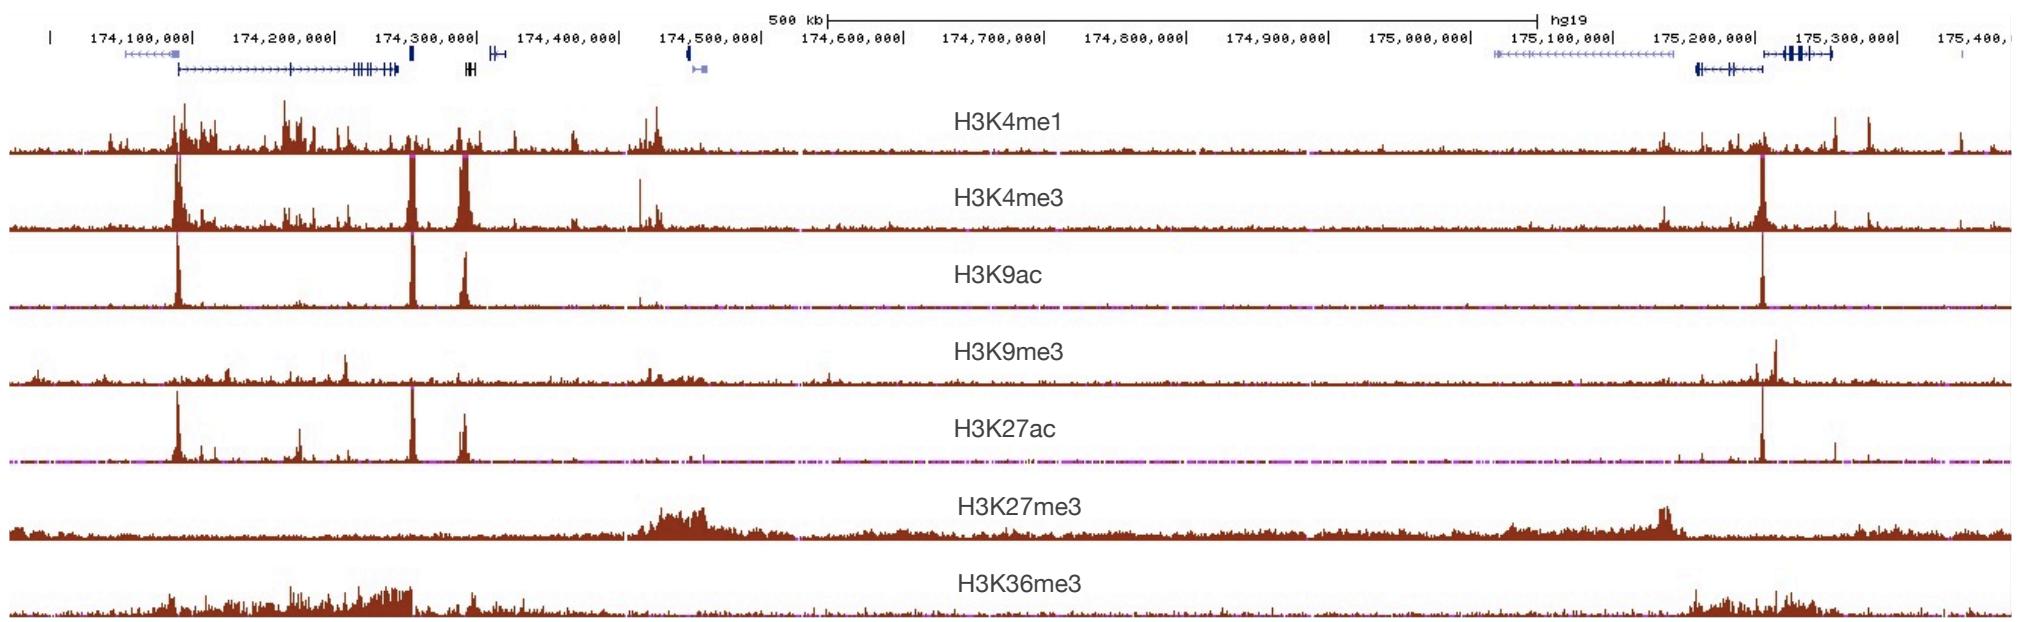

[Wilbanks & Facciotti
PLoS One (2010)]

Histone modifications

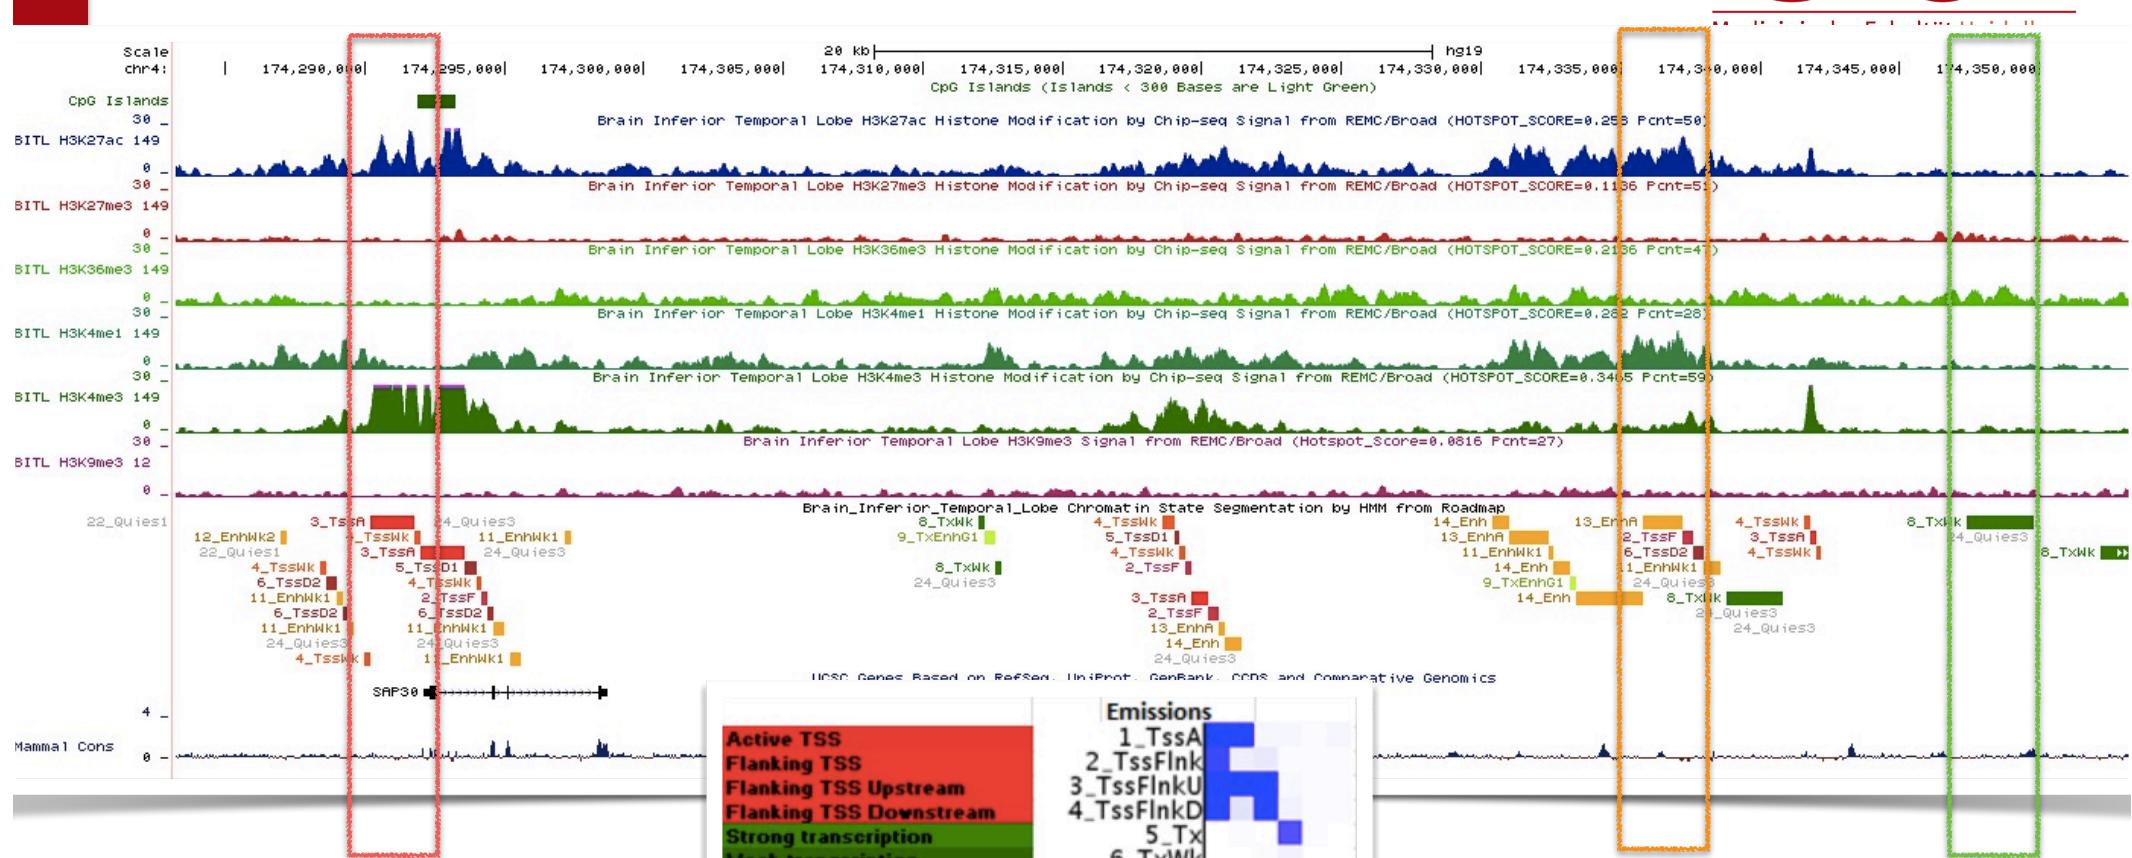

Medizinische Fakultät Heidelberg

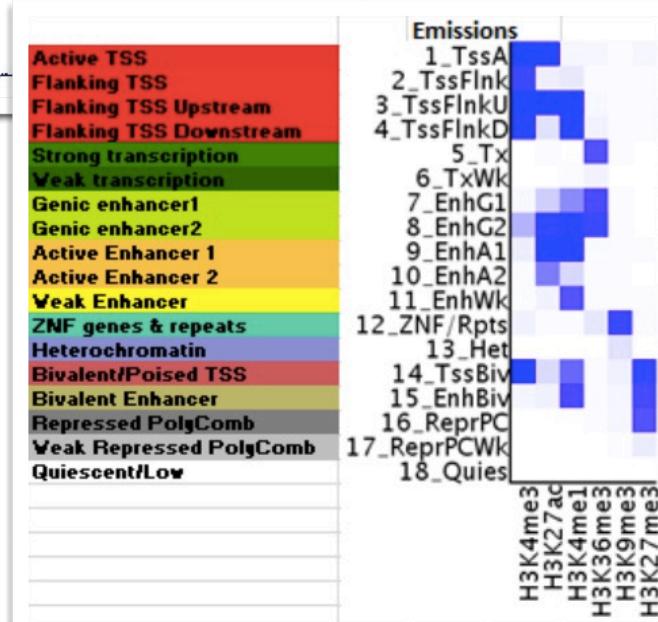

- Histone marks have **distinct signal profiles**
 - sharp signal : narrow peaks of enrichment at specific loci (H3K4me3 = promoters, H3K27ac = enhancers,...)
 - broad signal : wide regions of enrichment (H3K36me3 = transcribed genes; H3K27me3 = repressed regions)

Chromatin states

Active Transcription
Start Site
= H3K4me3 + H3K27ac

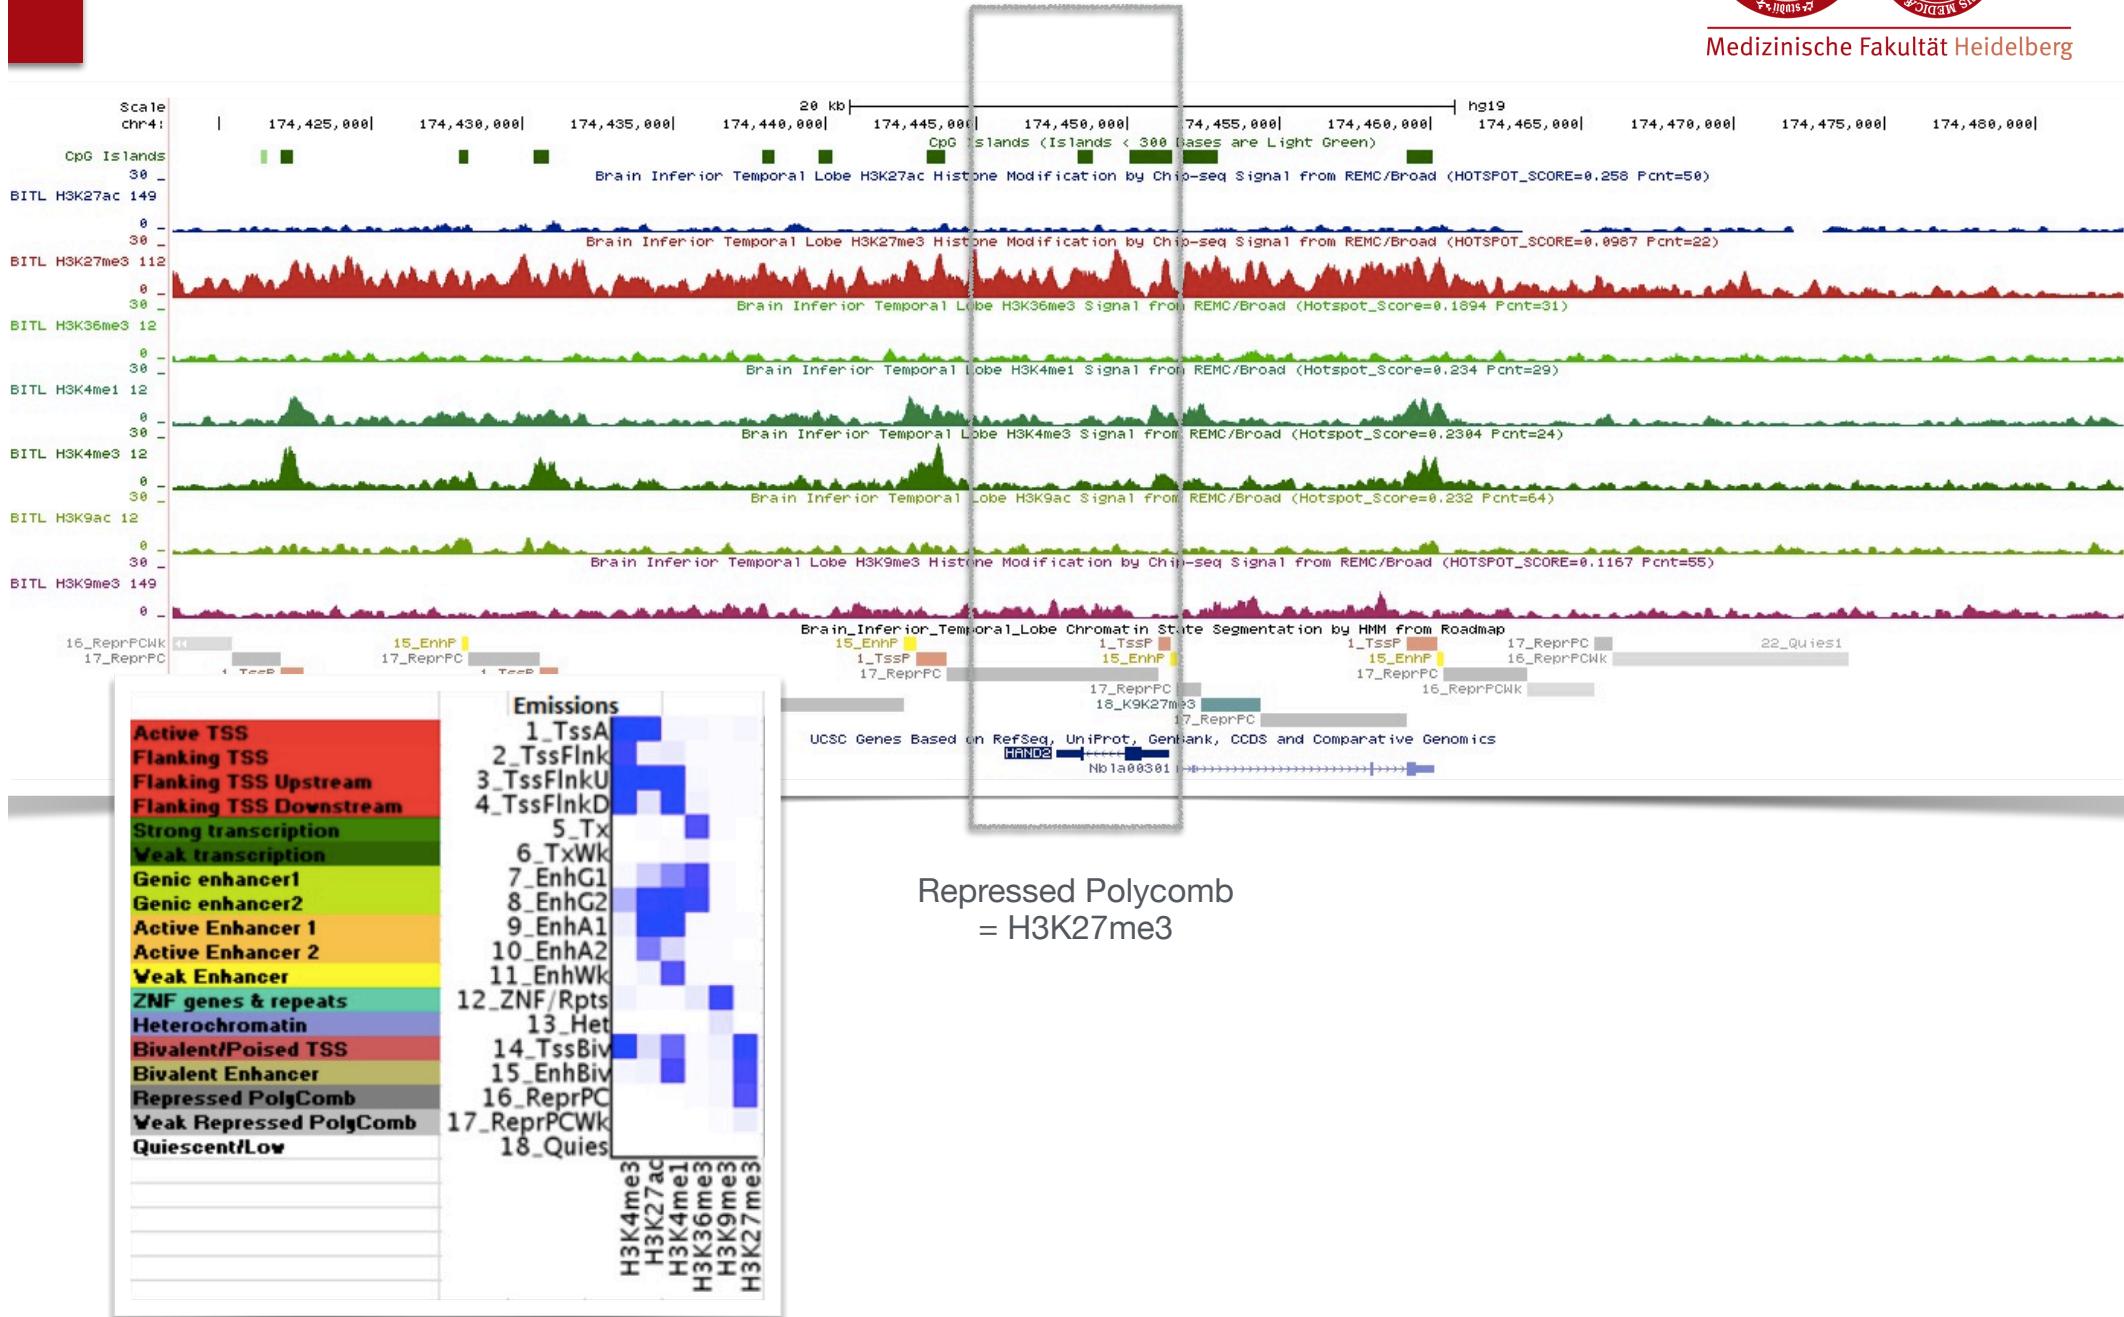

Active Enhancer
= H3K4me1 + H3K27ac

Transcribed region
=H3K36me3

Chromatin states

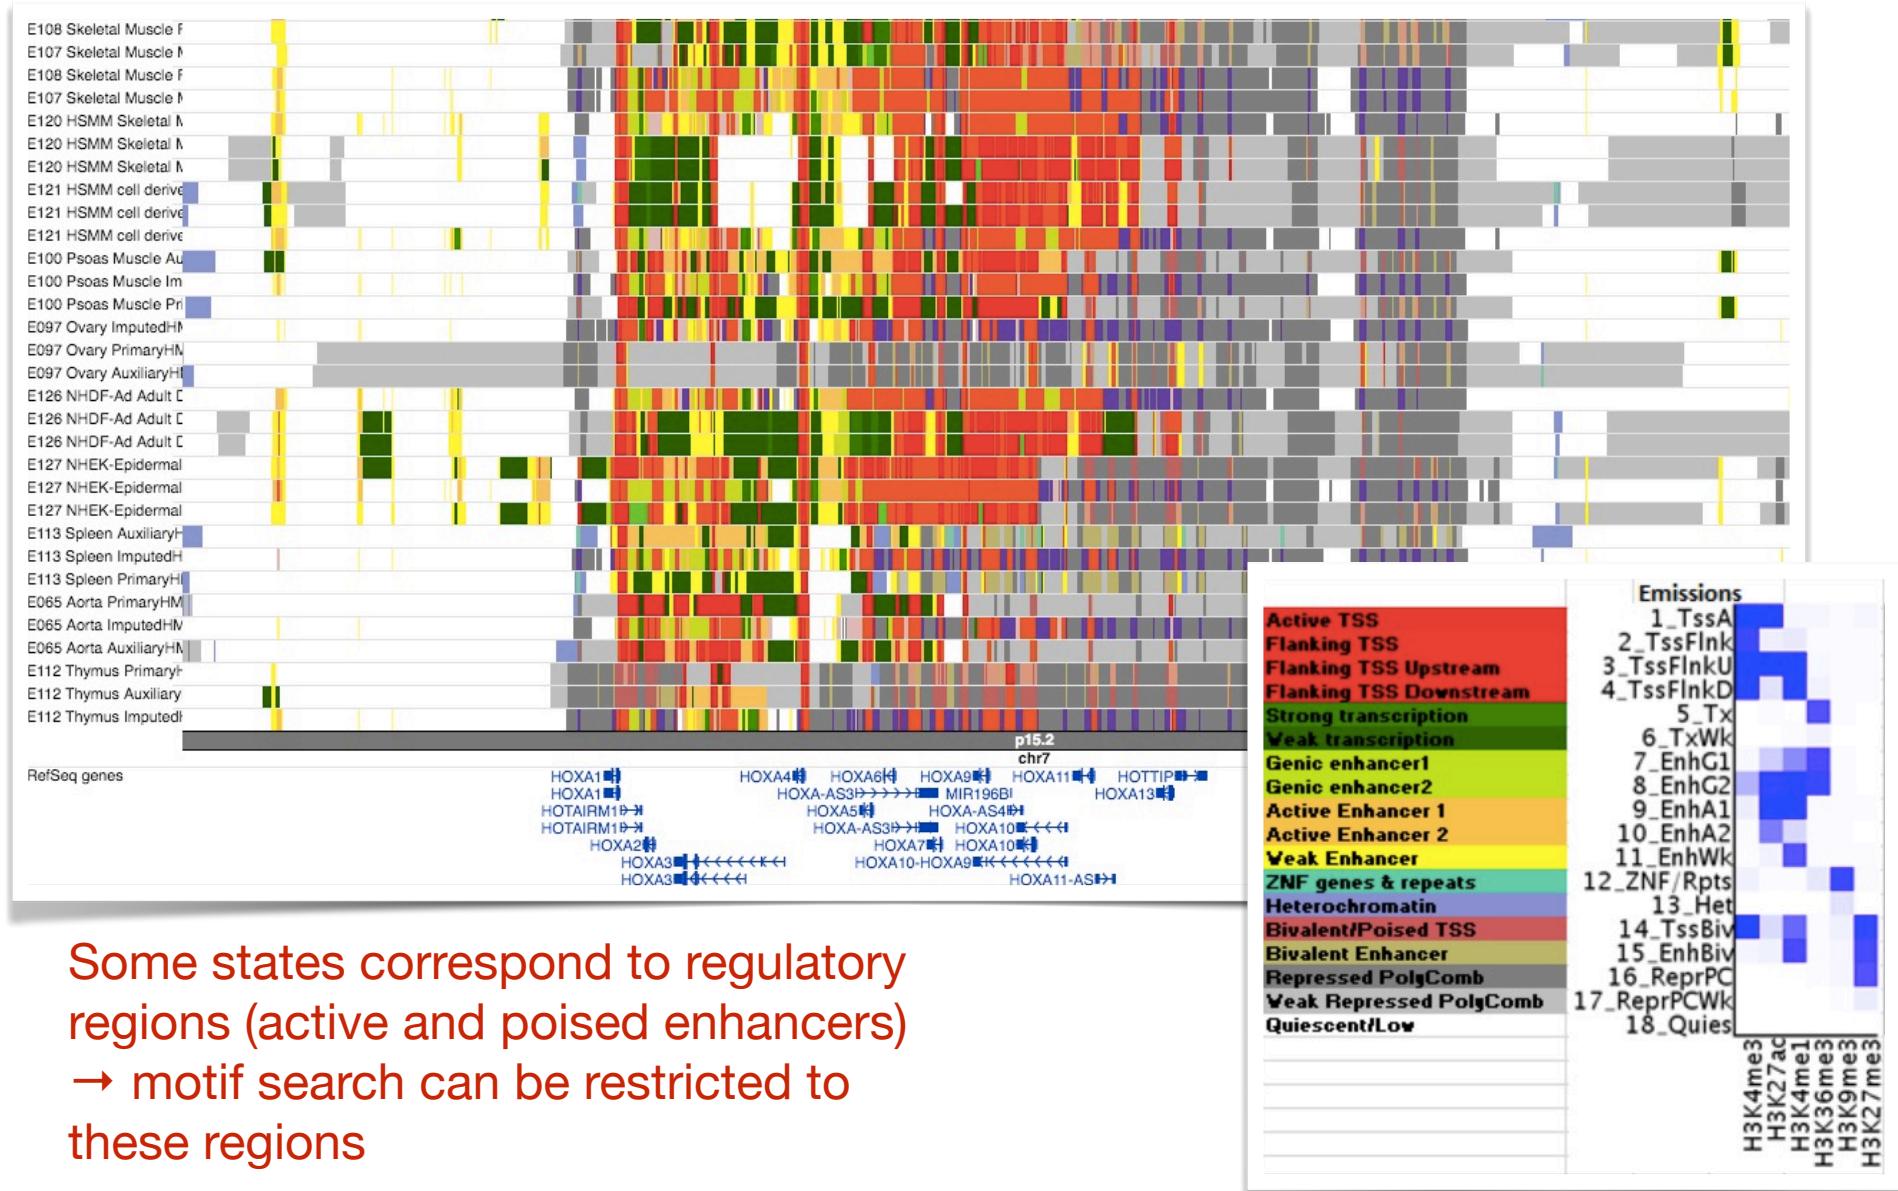

Medizinische Fakultät Heidelberg

Roadmap chromatin segmentation in different human adult tissues

Medizinische Fakultät Heidelberg

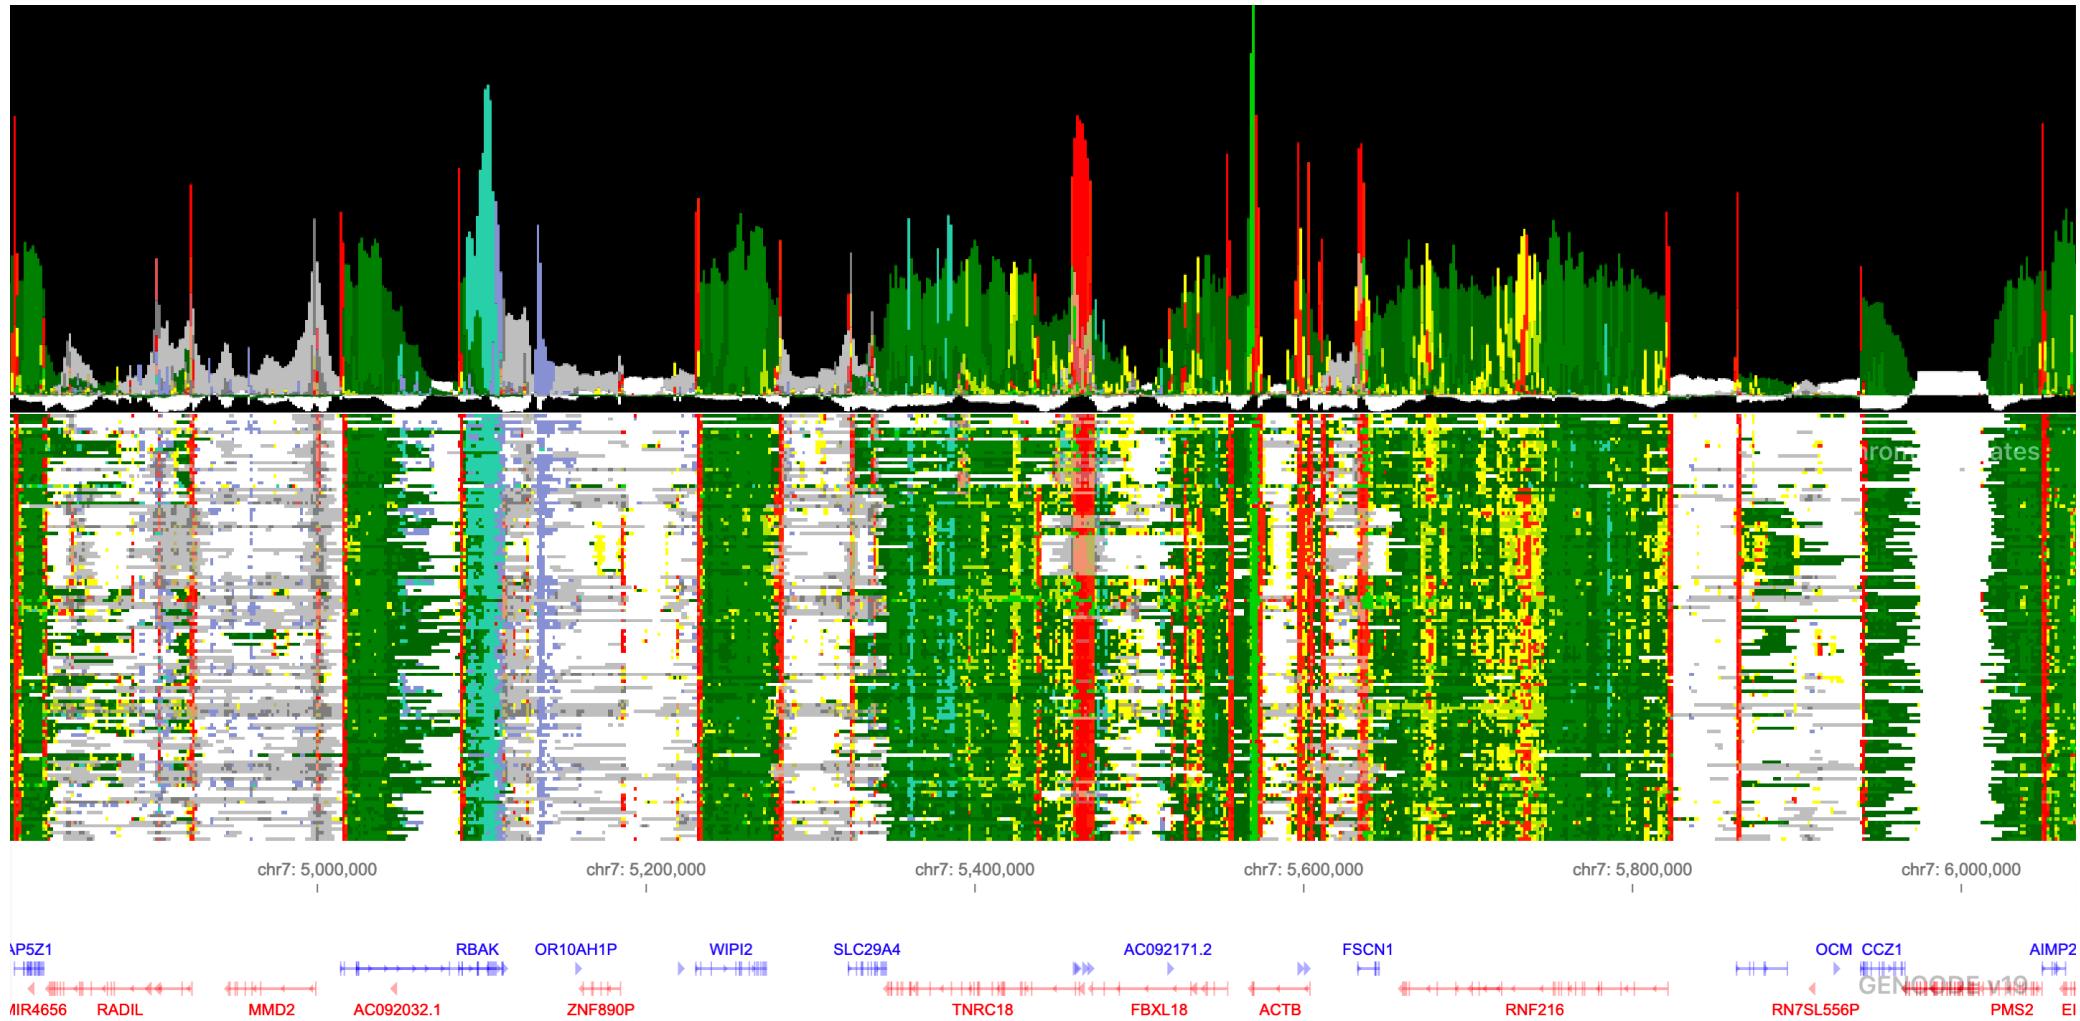

Some states correspond to regulatory regions (active and poised enhancers)
→ motif search can be restricted to these regions

Example of ChIP-seq signal for transcription factors / DNA-binding proteins

Principle of ChIP-seq

Medizinische Fakultät Heidelberg

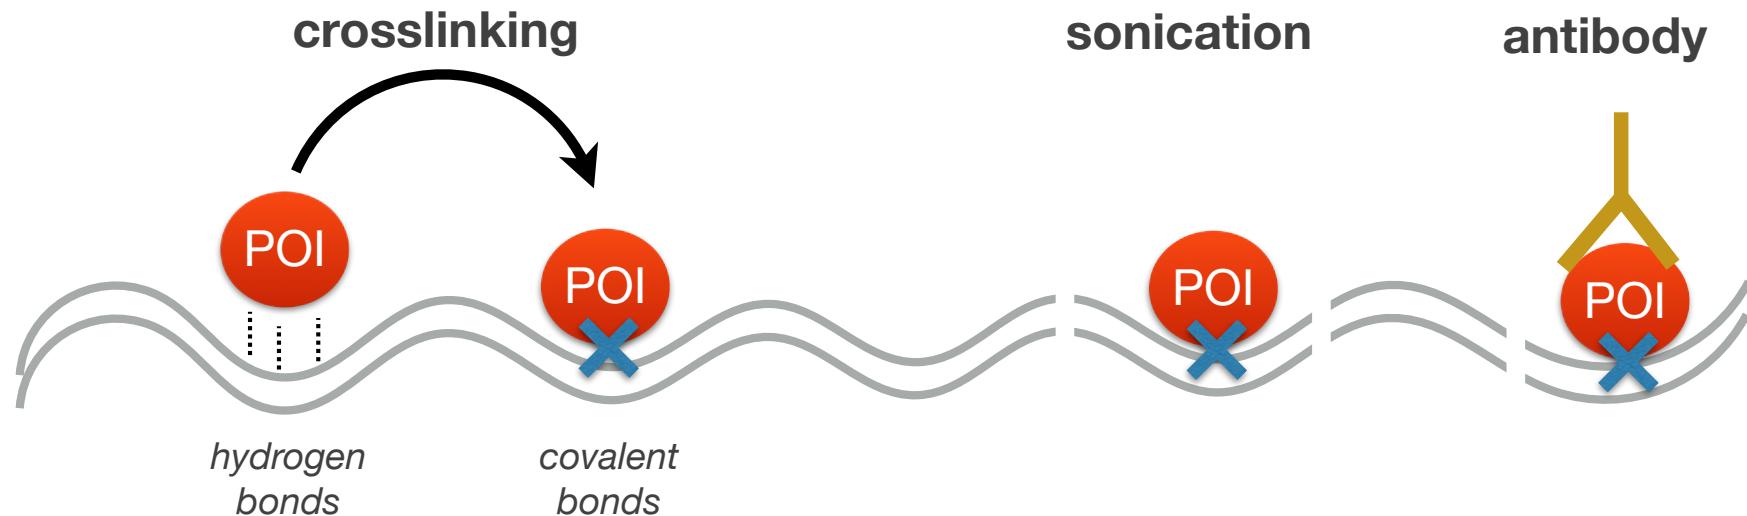

ChIP-seq

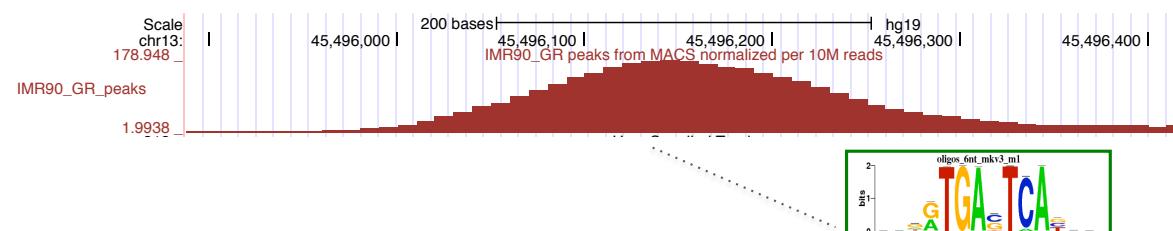

Medizinische Fakultät Heidelberg

- Crucial steps in conventional ChIP-seq
 - cross-linking of the protein to the DNA
 - sonication of the cross-linked chromatin
 - antibody

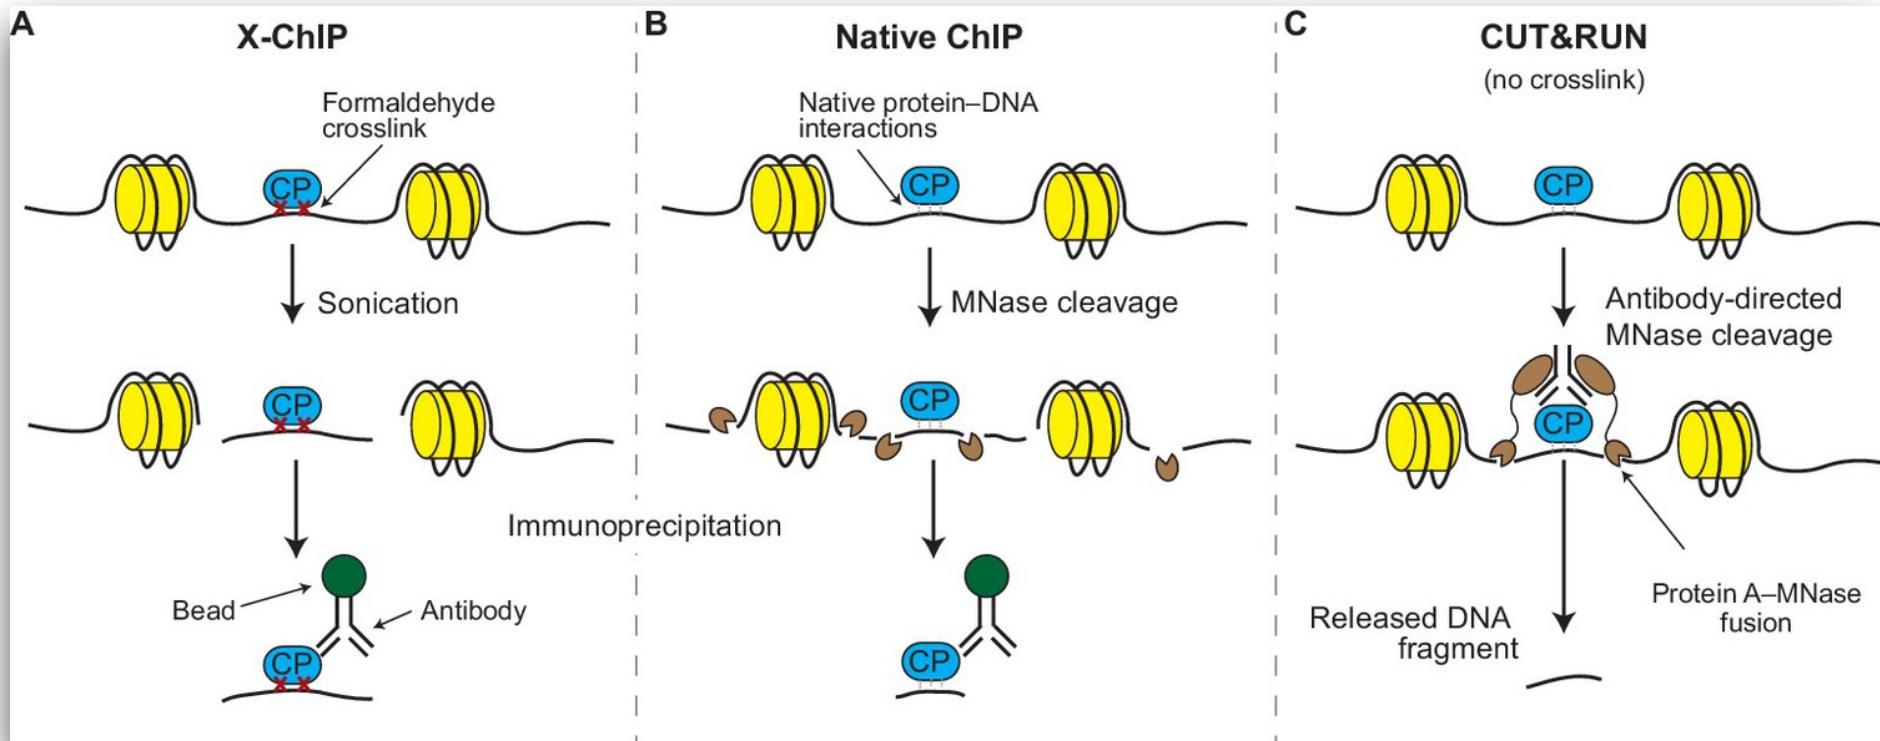

*low resolution (200-300bp)
background noise due to
crosslinking*

Alternative protocols

Medizinische Fakultät Heidelberg

standard protocol with
crosslinking

no crosslinking
cleavage using MNase

no crosslinking
MNase guided through tethering
to antibody

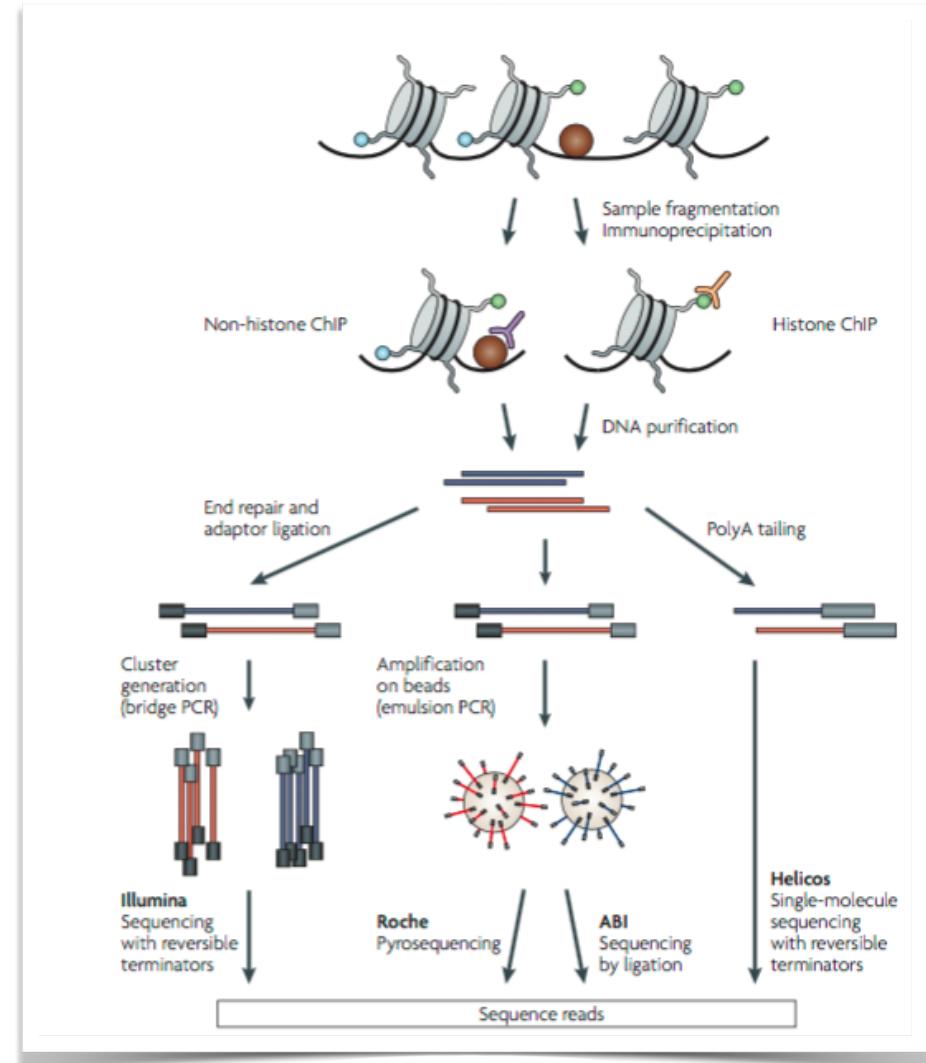

[He & Bonasio, Elife 2017]

Controls in ChIP-seq

Medizinische Fakultät Heidelberg

- **Input DNA:** controls biases due to chromatin fragmentation (natively open regions,...)
- **Unspecific IgG (mock-IP):** controls for unspecific IP enrichment
- **H3 antibody (for histone ChIP-seq):** controls for the presence of histones

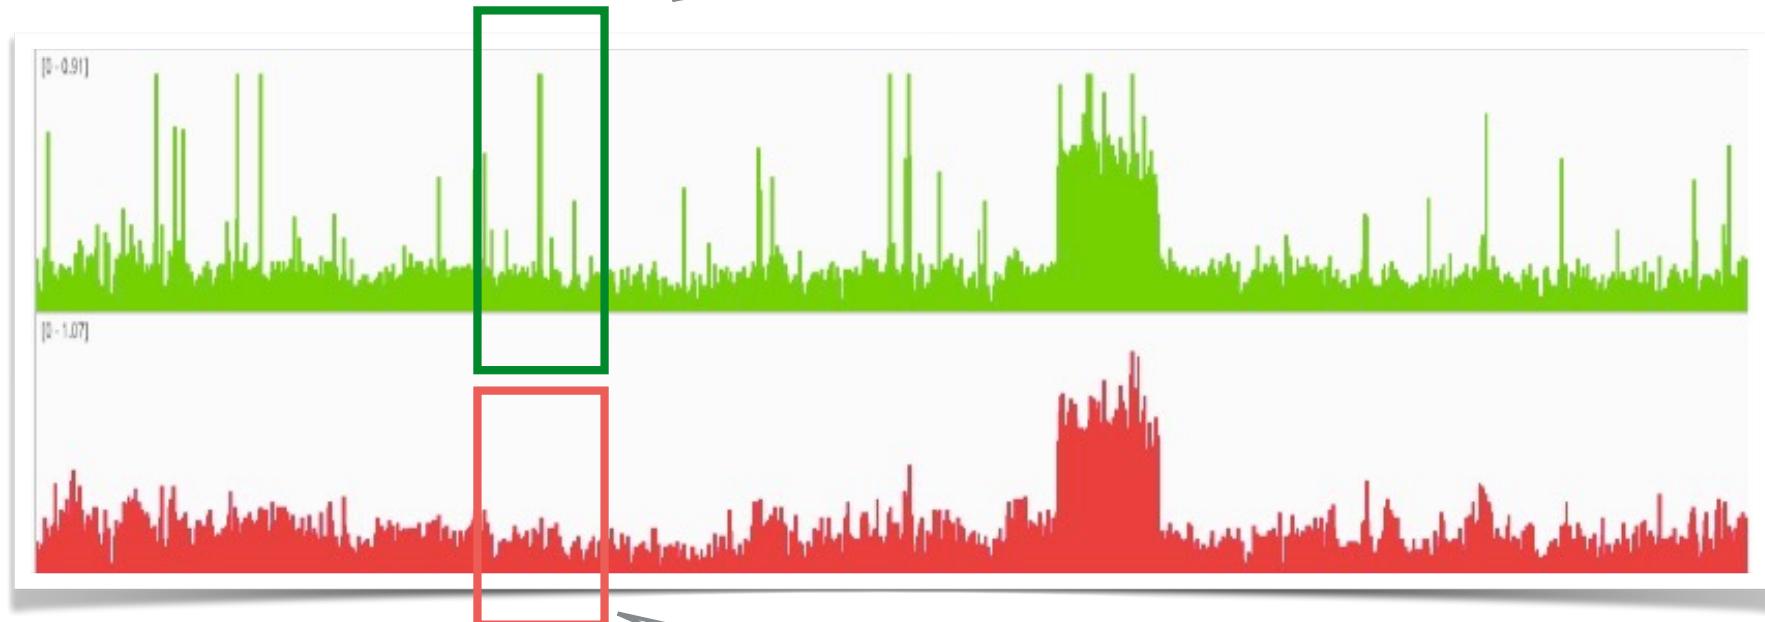

Fundamental question in ChIP-seq analysis

Medizinische Fakultät Heidelberg

Signal ("treatment")

*Do we have
more signal here ...*

Background ("input")

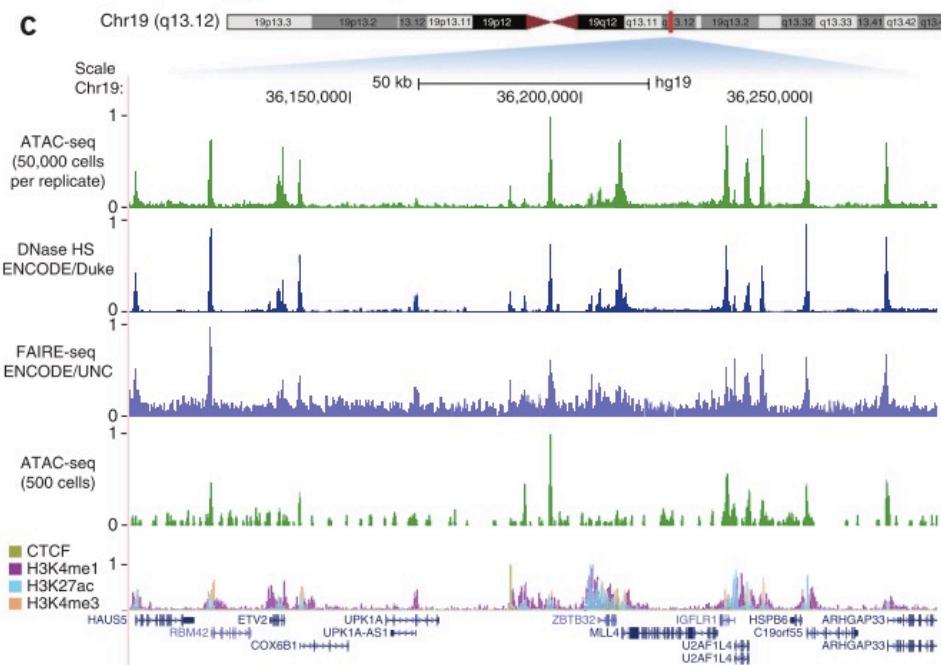

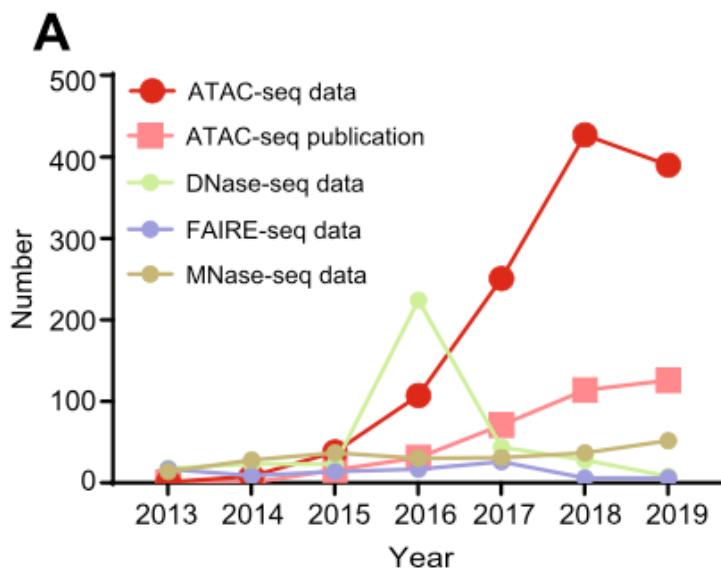

...than here ?

ATAC-seq: finding open regions

Medizinische Fakultät Heidelberg

- Several experimental methods available to identify open chromatin regions

- Lower input material required [Greenleaf (2013)]
- Simpler protocol with less steps
- Comparable sensitivity/specificity compared to DNase-seq

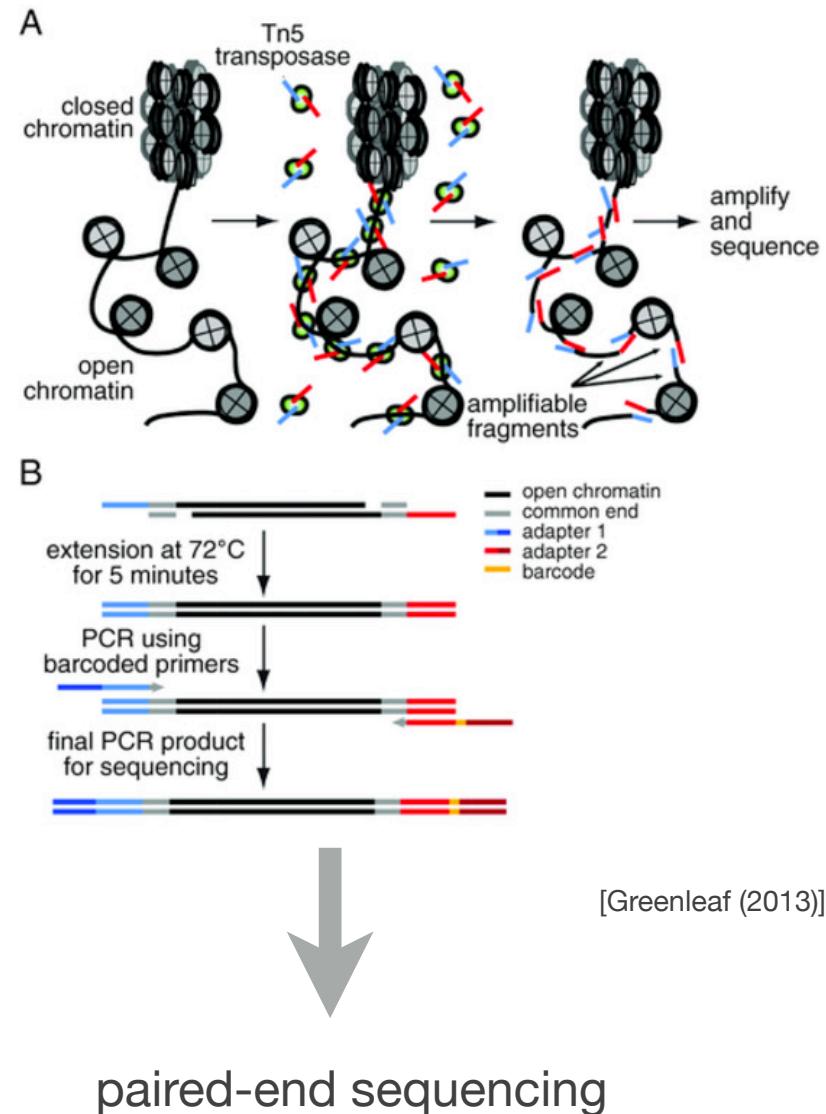

[From reads to insight: a hitchhiker's guide to ATAC-seq data analysis;
Yan et al. Genome Biology 2020]

ATAC-seq : finding open regions

Medizinische Fakultät Heidelberg

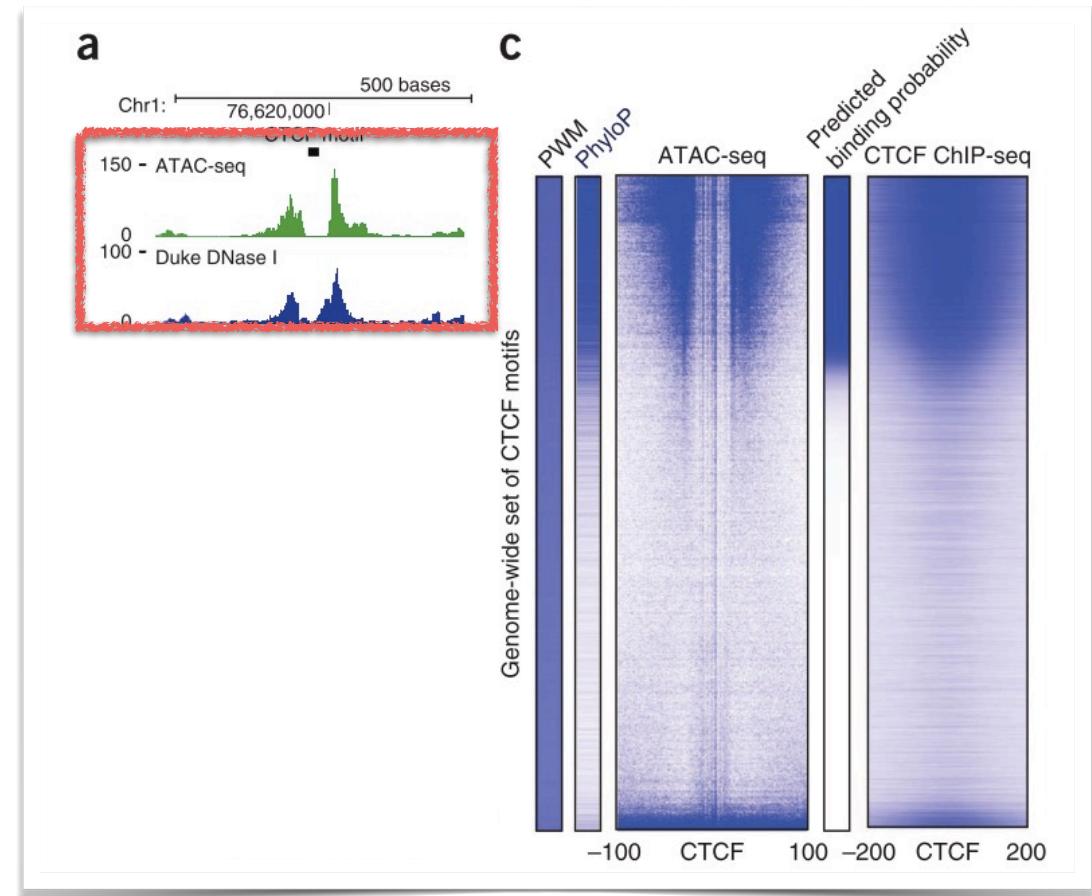

- ATAC-seq: using Tn5 transposase prepared with sequencing primers
- requires a small number of input material (~10,000 cells)
- identification of open chromatin regions (peaks)
- **There is no control in ATAC-seq experiments (unlike ChIP-seq)**

[Greenleaf (2013)]

Footprinting

- From open regions to transcription factor binding sites
→ **footprinting**
- Zooming into the peaks (open regions) : valleys of undigested / un-transposed DNA
→ **TF binding sites (TFBS)**
- binding sequence can be identified with base-pair resolution

[Greenleaf (2013)]
